

```
> ggplot(l, aes(x=length, color=corr, fill=corr)) + geom_histogram(binwidth=0.1)
```

```
> ggplot(l, aes(x=tournament_year, fill=corr)) +  
+   geom_bar(stat="count", position="dodge")
```

```
> ggplot(l, aes(x=l$answer_type, fill=l$corr)) +
+   geom_bar(stat="count", position="dodge", width = 0.2)
```

I have included these 3 parameters as shown in the plots to build a model so as to increase its accuracy. Here, there are more correct answers if the answer type is work. Also, for tournament year 2007, 2008 and 2009, there are more incorrect answers. I believe these parameters will help in making correct predictions.
